

What's the colour of music? It's your call.

"Choose any colour you want as long as it's black", said a famous Ford. At *TP-Filter* we simply say choose (almost) any colour! Looking for aesthetic visible mesh with a textile surface to cover loudspeakers or microphones? Our new non-conductive innovation features a pigmentation technology that gives filters for loudspeakers/microphones in mobile phones and diverse sound equipment a substantially better colour appearance than dyed fabric. *Soundmesh® Bright Colours* is designed to allow a stock protective acoustic mesh applied behind for protection. In addition it is acoustically transparent.

TP-Filter is a technology leader with more than 20 years of experience in developing and constructing a broad range of filter products. We continuously synchronise materials, details and design in accordance with our industrial customers reality.

**Quality-line**
